REQUEST FOR INFORMATION ON USE OF ICPSR RESOURCES

To provide funding agencies with essential information about use of archival resources and to facilitate the exchange of information about ICPSR participants' research activities, users of ICPSR data are requested to send to ICPSR bibliographic citations for each completed manuscript or thesis abstract. Please indicate in a cover letter which data were used.

DATA DISCLAIMER

The original collector of the data, ICPSR, and the relevant funding agency bear no responsibility for uses of this collection or for interpretations or inferences based upon such uses.

DATA COLLECTION DESCRIPTION

Stephen D. Gottfredson and Don M. Gottfredson

CRIMINAL VIOLENCE AND INCAPACITATION IN CALIFORNIA, 1962-1988
(ICPSR 9922)

SUMMARY: These data were gathered to investigate the usefulness of statistical methods, particularly multiple-regression analysis, in predicting repeat criminal activity subsequent to an individual's release from prison. The data collection consists of follow-up information, collected in 1988, on a sample of males released from California prisons. The follow-up study identified criminal activity subsequent to individuals' release from prison through 1988. Predictor variables include age, prior periods of arrest, history of drug use, seriousness of original offense, and number of arrests for nuisance, person, property, and fraud offenses.

UNIVERSE: Adult men released from California prisons between 1962 and 1988.

SAMPLING: The original sample was chosen to be representative of men in California prisons in the early 1960s. The follow-up sample is the original sample less those cases lost due to attrition.

EXTENT OF COLLECTION: 1 data file + machine-readable documentation (text) + SAS data definition statements + SPSS data definition statements

EXTENT OF PROCESSING: MDATA.ICPSR/ REFORM.DATA/ DDEF.ICPSR/

PURPOSE OF THE STUDY

The Justice Policy Research Corporation conducted this study to examine the extent to which statistical models are useful in predicting the likelihood of repeat criminal activity after release from prison. The sample was chosen in the early 1960s and was intended to be representative of all men in California prisons at that time. A follow-up study was done to identify criminal activity subsequent to individuals' release from prison through 1988. The follow-up study contains data on 4,897 men.

METHODS

STUDY DESIGN

The original sample, selected in the early 1960s, contained over 6,000 individuals. The follow-up study attempted to include all individuals contained in the original sample. However, the California Bureau of Criminal Statistics and the California Bureau of Criminal Investigation were not able to provide records for all individuals, and attrition occurred for a variety of reasons. No records were provided for some individuals who had died. In some instances the individual was not released from prison. Some records were unusable (e.g., missing pages). A number of records were "purged" from the California system if the individual had reached age 70 and there were no known arrests in the prior ten years. These sources of attrition resulted in a follow-up sample of 4,897 individuals. Attrition may result in some sample bias. All deaths of individuals from the original sample may not be recorded, and unrecorded deaths may inflate the amount of time free without arrest. Complete records of out-of-state arrests were not available, and this may also inflate time without arrest. Purging of records should counteract the effects of unrecorded deaths and out-of-state arrests, since those remaining in the sample would tend to have had more arrests. The researchers

compared characteristics of purged and retained cases and concluded that there appears to be little serious bias associated with sample attrition.

SOURCES OF INFORMATION

Follow-up data were provided by the California Bureau of Criminal Statistics and the California Bureau of Criminal Identification. Background data were collected from California Department of Corrections data.

SAMPLE

The original sample was chosen to be representative of men in California prisons in the early 1960s. The follow-up study contains the original sample less those cases lost due to attrition. When possible, the California Bureau of Criminal Statistics provided computerized records for the individuals. In other cases the data were manually prepared.

RESPONSE RATES

There are 4,897 members in the follow-up study representing 78 percent of the 6,310 members in the original sample.

DATES OF DATA COLLECTION

1962-1988

SUMMARY OF CONTENTS

DESCRIPTION OF VARIABLES

Data gathered for predictor variables include age of the individual, prior periods of arrest, history of drug use, type of offense, and seriousness of offense. Data regarding criminal activity subsequent to release from prison include number of arrests for nuisance offenses, person offenses, property offenses, and fraud offenses.
